

The main objective of Life+Nature Resilfor is to safeguard the formations of beech with local Silver fir through the reconstitution of new groups of *Abies alba* in areas more appropriate for the future survival and retransmission of species.

Secondary objectives are the reconstruction of groups of *Taxus baccata* within formation of beech with holly, is and improve the breeding sites of *Salamandrina perspicillata*, *Bombina pachypus*, *Roselia alpina* and *Lucanus cervus*

The project seeks to achieve the main objective through actions that each separately has a secondary goal. Therefore actions have been defined which have the objective of increasing the presence of forest formations of native species including native appenine Silver fir (action c2 and c3), actions that aim to reduce numerical allochthonous silver fir and exotic conifers (action 4), actions that are intended to provide certified material of native origin (action 1), actions aimed at the redissemination of *Taxus baccata* (action C1 and C5) and finally specific actions aimed at protecting and promoting the expansion of

*Salamandrina perspicillata*, *Bombina pachypus*, *Roselia alpina* and *Lucanus cervus*  
. (action C6).
