

Initiated the action "C2" for SCI "Alpe della Luna Bocca Trabaria". The first cutting of the forest areas have been implemented and will be completed in the autumn with the planting of *Abies alba*

,
local provenance.

Each of the 25 areas covered in the site have the average size of 500 m² and feature a band of sparse boundary of about 3000 m

2

.

The cuts remove especially medium, small trees of beech, and left big and old trees. The old trees are very common in some SIC areas, they derived by old cultural cycles when the beech forest

w

as used for pasture. The old plants are very rich of necrosis and rot wood that represent very important microhabitat for saproxylic insects.
